

These three years have also set apart the leaders from the crowd with the Apple Watch and its watchOS leading the pack, followed by Samsung's Tizen and Android Wear.

Just like their mobile counterparts, watchOS and Android Wear have some obvious differences. watchOS has a nicer and cleaner UI compared to its competitors. Android wear has more customizability options, at least in terms of watch faces, whereas in watchOS you get to select only from the preset faces, Android wear lets you install third party faces. It also added support for its voice based virtual AI assistant, the Google assistant, with its new release. Both OSes come with a growing app store and support from third party developers, and it will be at least some time before we could see a clear winner,

Surprisingly, Tizen overtook Android Wear in Global market share this year. About two years ago Samsung stopped making smartwatches running on Android wear and instead started using their home brewed Tizen OS which powered their Z series of smartphones and smart TVs. At that time, it held a measly 7% market share. Fast forward to 2017, it crossed Android Wear's market share and powers some of the best non-apple smart watch in the market currently, namely the Samsung Gear S2 and S3 series. The OS comes with a number of neat features that help it give competition to Android Wear like inbuilt Samsung Pay, LTE connectivity, various activity and health tracking features and deep integration with Samsung Galaxy smartphones. It supports both iOS and Android devices too.

Though to compete with the watchOS, it needs to do and be more. It still lacks many features that watchOS supports like an AI powered assistant and ability to control smart home devices. Overall, the watchOS provides a more complete and feature rich ecosystem, which probably is currently the best in the market right now.
