

HomeKit enabled devices through the voice enabled AI assistant residing on your phone.

Whenever a new technology comes up, the second argument you hear about is its security and smarthomes and smarthome devices are no different. The industry has already been abuzz with these concerns for quite some time now. But if you are using HomeKit enabled devices, you can relax, at least a bit, as all communication between any two devices or your apple device and the smart accessory is 'end to end' encrypted.

HomeKit is still not a widely popular standard though, something you'd both want and expect from Apple when you are buying into their smart home ecosystem. The reason behind this are the strict policies, rules and regulations that Apple has implemented, which manufacturers have to meet before developing and launching HomeKit enabled accessories. Any manufacturer willing to implement it in their device, will have to join Apple's Made for iPhone certification program, sign up for its licence, and meet all the requirements. Once this is done, it's Apple who decides whether the device is upto the mark or not, and only once approval is received, will the device get to display a "Works with Apple HomeKit" badge. All this makes for a lot of extra effort which many manufacturers are not willing to put in, just yet. Nest, one of the leading manufacturers of smart home devices in the market right now, has no HomeKit enabled device and isn't planning on coming out with any soon.

Though things are slowly changing. With the launch of Apple Home, a central app that lets you control all your HomeKit enabled devices from

Apple's official website has a list of all HomeKit enabled smart devices currently available in the market
