

to rename your house, set a background wallpaper for the app, add other users and leave notes for them.

Room

Once you have added all the devices in your house to your app, you can segregate them into 'Rooms' based on their physical location or whatever way you want. You can create scenes for specific rooms, and access all the devices in a room from one location. The devices which aren't added to any room are put into a default room. This is a very nice feature which de-clutters your home letting you easily access any device and offers more flexibility.

Automation

This is the golden egg, something which the standalone HomeKit lagged. Automation lets you automate device activities based on time of the day, particular day, activity of a particular device in your home grid, sensor response or your activity and position inside the house. But to actually be able to use this feature, one needs a 4th Generation Apple TV or an iPad running iOS 10 to act as a hub.

Other features

- The home app and Siri are not the only way you can control your smart home now. A new pane has been added to the swipe up control center, that lists upto 9 favorite devices and 8 scenes which you can directly access and control from your lock screen, or anywhere on the iPhone.

This is what the Home landing page can look like after some customisation

'Automation' lets you automate various activities based on various different parameters
