

- For the Automations to work and for you to be able to control your smart home from far away, a central hub is needed. This hub can either be the Apple TV 4 or an iPad running iOS 10. All you have to do is leave your tablet connected to your home network when you are going away, and it will control and take care of your smarthome
- The home app is also supported on the Apple watch. This app is basic compared to its iOS counterpart, but it lets you toggle your devices on or off and control some of its basic features right from your wrist. You can also select between different scenes.
- Homes is a multiuser app and obviously you won't be the only one controlling all the devices in your home when you have five more people living with you. Home takes care of this seamlessly.
- The Home app has a very intuitive feature called 'scenes' where you can set up a particular scene along with a phrase, which when said activates it. Scenes, basically allows you to control multiple devices simultaneously and make them work and activate with a single command. So you can set up a 'Scene' called "I am leaving" such that every time you say it, all the lights in your house are turned off, the thermostat goes in a passive state and the blinds are drawn close. Pretty cool eh? This is as close as it gets to JARVIS in real life, at least right now.
