

to a wide range of music catalogs. You will be able to control and manage HomePod with the help of Siri. The addition of natural voice interaction is supposed to help you to communicate with the speaker easily and accurately. The device is supposed to adapt to the environment to be able to deliver high fidelity sound irrespective of where you place the speaker.

If you place multiple HomePod units on the same room, it will automatically detect and each with each HomePod unit. If you keep the HomePod units in separate rooms, the speakers will automatically establish connectivity with each other via AirPlay 2. Hence, you will be able to activate music all over the house. The HomePod can control AirPlay 2-enabled third-party speakers as well.

To play and search for songs, you just need to ask Siri on the HomePod. Apple has also integrated several security enhancements such as encryption and anonymous ID, which aim to protect your privacy to a large extent.

In addition to message management, the HomePod includes the ability to fetch instant updates on sports, weather, news, entertainment, technology, finance and traffic. Furthermore, you can smartly control other smart devices around the house via the HomePod. Simply tell Siri what to do. For example asking Siri to switch on the lights. The speaker will also serve as a hub by providing remote access and home automation with the help of the Home app available on iPad and iPhone. More info: http://dgit.in/apple_homepod
