

six-microphone array enables advanced echo cancellation and the signal processing needed to tweak sound output on the fly is handled by the A8 processor. This microphone array also allows Siri to listen to the commands even if you are standing away from the speaker.

The speaker has been integrated with an internal low-frequency calibrated microphone, which provides enhanced bass correction. The HomePod also provides support for direct and ambient audio beamforming including dynamic processing.

You will be able to know whether the HomePod is working or not by viewing the LED Siri waveform, which appears on the top of the unit. The moment you utter a specific word, you will view the wave in action. The embedded touch controls help you to work with the speaker easily with simple navigation.

To work with the HomePod, you just need to place an iPhone adjacent to the speaker and the unit will play the music immediately. You can adjust volume levels including pausing music by tapping on the top of the speaker unit.

Apple has designed HomePod to take maximum advantage out of Apple Music, which has access to a huge library of music from around the world. Moreover, the speaker inherits all the core features of the Siri voice assistant, which is well known to iOS users. Since the HomePod works with HomeKit products, you will be able to command a range of accessories (http://digit.in/apple_homekit) such as lights, switches, outlets, thermostats, windows, fans, air conditioners, sensors, security, locks, cameras, doorbells, garage doors

Communicate with HomePod accurately even if you are located far away from the speaker
