

and bridges using the HomeKit platform. You can control all the accessories with your HomePod by adding it to the Home app.

Apple has infused a few security features into the HomePod. The device works only after Hey Siri is recognized locally on the device. Once the command is recognized, the relevant information will be delivered to Apple servers in an encrypted manner. The required data will be sent via an anonymous Siri identifier.

How does the HomePod compare to its competition?

Apple HomePod works with Siri and syncs easily with Apple Music. You will be able to interactively ask Siri to perform any task including music management. The speaker is powered by Apple A8 processor and can be used across multiple rooms with AirPlay 2.

Amazon Echo (http://dgit.in/echo_speaker) is also a voice-controlled speaker but it is powered by Alexa instead of Siri. You can play music from a wide range of sources such as Amazon Music, Pandora, TuneIn, Spotify, and iHeartRadio and much more using voice. However, if you look at the HomePod, the speaker only provides support for Apple Music. We can't really comment on the audio quality, but in terms of specs the HomePod ships with 7 tweeters, while the Echo speaker includes a 2-inch tweeter.

Amazon also sells a smaller variant named Echo Dot, which is priced at \$49.99. However, you need to connect your speakers either using Bluetooth

Apple HomePod expected to compete with Amazon Echo and Google Home
