

# AIRPLAY AND AIRDROP

Is Apple's wireless sorcery truly magical?

Apple's stance on future connectivity by removing ports on iPhones and Macbooks isn't anything new – they've had an anathema against wires for many years now. But taking it up a notch, they decided they just had to do away with two of the most common physical connections in any techie's life – aux cables for audio and data cables for transferring stuff from computers. At this point we could easily cue in a first world rant about how you need to buy a dongle to connect your spanking new iPhone 7 with your spanking new Macbook, but we'll spare you the horror. However coming back to Apple's penchant for cutting wires, this is precisely where AirPlay and AirDrop come in. Both of these are over-the-air, WLAN data transfer protocols that allow you to play music and transfer files respectively.
