

3rd generation roughly falls down to around \$69. You can also find 2nd generation costing around \$22 on some sites, but who in their right mind would go for a two generations prior device.

Hardware

The name Apple TV might let people to believe that its an actual television and not an external streaming device that attaches to a TV. But this is what the Apple cart has to offer – something similar to a set-top box that helps you stream content on your HDTV. The Apple TV 4 is clearly more powerful compared to its first generation sibling. It sports an Apple A8 64-bit CPU, and comes with 2GB RAM and is fairly decent for gaming (more on that in Chapter 11).

On the back of the device you can find ports for built-in power supply, HDMI, USB-C type and 10/100 Ethernet.

Apple TV 4 has 802.11ac Wi-Fi for connecting to your wireless network. The new device does not support optical audio output, unlike its previous variants – a slight bummer.

The media streaming device also has an infrared (IR) receiver, and Bluetooth 4.0 wireless technology. Apple TV has an in-built power supply, which negates the need for a separate bulky AC adaptor.

Coming to the size and weight of the Apple TV 4, the box weighs about 425 grams and has dimension of 98*98*35 mm. Quite compact indeed.

A key highlight of the new Apple TV is the Siri remote, which makes the device all the more appealing. The new remote sports a touchpad and six buttons; it also has a microphone, so you can command Siri to find a
