

latest iMac, it's going to cost you a bomb. However, if the games you play aren't too graphics intensive, are mostly casual games, or aren't relatively recent, most mid-range Macs should also be able to run them no problem.

Macworld has compiled a neat list of 141 games you can play on your Mac which you can check out here: <http://dgit.in/141macgames>

## Gaming on Apple TV

Apple TV is relatively new and hasn't been around as much as the rest of Apple's contenders. However, when it was announced there was a lot of hype surrounding it. People were even calling it Apple's gaming console while imagining the possibilities the little device could unlock. However, the gaming aspect somehow failed to take off. There are many factors as to why but it doesn't mean that it still can't take off.

Apps on Apple TV weren't exactly designed for the TV console gaming audience. So if you happen to have gamed on a console before, you're not going to be impressed by what Apple TV has to offer.

The Apple TV doesn't measure up to other consoles in terms of specifications. In terms of power it's about as powerful as an iPhone. Next you have the Siri Remote, while it has features that some console controllers have, i.e, a touchpad and motion sensors, it just doesn't feel like a gaming controller in your hand. However you can circumvent this by just buying a bluetooth controller that's compatible with Apple TV.

The Apple TV simply isn't cut out to be a gaming console
