

and still can pack a decent punch in rendering video despite being woefully, nay almost comically outdated in terms of specs and iPhones – forgive us for the cliché – just work.

Apple has a finger in pretty much every major technological pie, from smartwatches to TV streaming boxes. With this chapter we aim to give you a broad overview into those very form factors and verticals in which Apple operates. A quick 101 of sorts to ease you into the Apple Appleness.

Oooh shiny!

Laptops

Apple currently offers two lines of laptops – The Macbook and the Macbook Pro. The Macbook (or the hipster machine, if you will) is an ultraportable machine that sacrifices a lot of performance and ports (it literally just has *one* USB-C port with Thunderbolt 3) to maintain a very low footprint with a 12 inch screen. It's completely fanless, thanks to its core m3/ i5 Y series processors and comes in four colours. It's primarily aimed at the people who need a stylish device to tote around and have only light tasks such as web browsing and productivity tasks such as word processing. The Macbook Pro, while not quite so svelte, is still thin and light enough
