

Explorer's rendering protocols. Though the contemporary browser giant, Internet Explorer was falling short of web standards in numerous cases, forcing web developers to unnecessarily tweak code to make pages render correctly. With the Acid2 test clearance, Apple's Safari shot ahead of the competition in one swift move.

Interestingly enough, many of the core team members from the Safari project have worked on other browsers. Dave Hyatt, instrumental in getting the browser to pass Acid2, worked at Netscape, and later on a primitive version of Mozilla. The self-taught Don Melton himself has contributed code to almost every browser before Safari.

Over the years, Safari has cemented itself with a solid user base – so much that Apple saw fit to cut out the entire Windows user section. Previously available for Windows (between the years 2007 and 2012), Safari is now exclusively a macOS and iOS software.

For the beginner – an intro to Safari

Safari is a full-fledged web-browser with a lot of cool features. It has full support for multiple tabs, extensions, bookmarks and history. It also has a built-in search bar cum URL bar, with various options for the default search engine. DuckDuckGo, a search engine with a complete non-intrusive policy, is one of the options as a default.

Apple shows a commitment to privacy and security with features like third-party cookie blocking to control data-mining from sites you might not even be visiting, and Private Browsing mode, where your history and activity are deleted at the end of the session. Similarly, Safari implements tab 'Sandboxing' - each webpage is run as a separate process, so that harmful

The Safari icons used to be different on Mac and iOS. Now they are the same. This shows the unified approach taken by Apple for the browser.
