

code designed to expose vulnerabilities in the system cannot affect the other tabs in a browser. This prevents malware and the like from crashing the entire system.

For users who own other Apple devices, Safari is an absolute godsend. The Reading List feature allows you to sync links and articles you might want to explore across all your Apple devices using iCloud. AirPlay sets up a direct video feed from Safari to the Apple TV, without displaying everything else on the screen.

Safari's intuitive Picture in Picture feature allows users to undock videos playing in any Safari tab and drag and resize them on the desktop like ordinary application windows. The sizable RAM on Apple's suite of devices allows this feature to incorporate entertainment with multitasking.

Safari's Share menu is a feature that has previously only been common on smartphones but users can now share the pages they're browsing via Apple Mail, Messages, AirDrop, notes, and many more integrated Apple applications.

Finally, Safari's beautifully designed Reader feature allows articles and news to be rearranged into an elegant layout with control on font, style, as well as theme. All this creates a beautiful, intuitive distraction free reading experience.

What's great about Safari?

Interface

Safari incorporates principles of simple, elegant design that Apple embodies and champions. Every interaction with the machine is made beautiful - from the swooping minimized tabs, to the intuitive placing of shortcut buttons. Safari integrates with the Notification Centre to provide Push Notifications of activity on open tabs. As of iOS 9 and later, Safari also comes with an in-built ad blocker for uninterrupted, annoyance-free browsing.

Performance

A perk of Apple's hand-in-glove hardware-software integration is a highly efficient browsing experience with Safari. Compared even with powerful renderers like Chrome, Safari uses much less CPU power and RAM - and by obvious translation, less energy. In fact, this can translate to as much as one whole hour of battery life more, compared with the use of Chrome.

Apple does boast certain areas of complete Safari superiority. On the JetStream test for advanced web-app based JavaScript performance, Safari
