

Safari offers obviously superior battery life

is about 1.2 times faster than Chrome, and 1.4 times faster than Mozilla. The MotionMark test for rendering of animated content places Safari a whole 1.5 times faster than Chrome. Finally, Safari beats the competition hollow in terms of everyday JavaScript rendering – a massive 7 times faster than both Chrome and Mozilla.

Integration

Safari is tightly integrated with iOS and macOS systems. A user can search in Spotlight and open a link directly in Safari. Clicking a phone number in the browser directly opens a menu to save or call it. Safari is also directly compatible with the iCloud suite – passwords, bookmarks, history, open tabs and even extension data can be synced across devices, and stored in the cloud.

Extensions

Safari has a wide market of extensions. More tightly regulated than the Google extensions, Safari Extension Developers need to apply for a license from Apple – another mark of Apple's tightly integrated software and high standards (or restrictive policies – whichever way you look at it).

As a result of this stricter policy, Safari does have far fewer extensions than its prime competitor, Google Chrome. However, standard popular extensions like notes services, bookmark managers, themes, mail trackers, search plugins and even fun games and browsing stats trackers are very much available and under constant development.

For the pros – things to appreciate about Safari

Apple's terms of service make it pretty obvious that no part of their income is based on advertising or selling user data. Apple keeps things cut and dry – they are about beautiful software and elegant hardware. For those who are concerned with privacy, this is a major case to use Safari.
