

The Google suite logs plenty of information about search terms, account usage stats, location, and pretty much anything it can get its hands on. Much of this data is liable to be used to target ads to the user. Apple, on the other hand doesn't seem much concerned with ads. Any information collected is ostensibly to improve user experience.

The KeyChain feature of iCloud allows for intuitive yet secure management of passwords across devices. While password managers like LastPass, 1Password, Enpass, and Keypass are increasingly being recommended for Linux and Microsoft users, the KeyChain protocol is built into the Operating System itself, lending it a great deal of reliability and security. Like any other password manager, KeyChain generates complicated, virtually impossible-to-hack passwords for different accounts – all accessible by a long (usually >30 character) master password set by the owner.

## The best Safari extensions

### Adblock Plus:

Though Safari 9 and later editions have inbuilt ad-blockers, more thorough control and blocking of ads can be achieved with Adblock Plus. With its simple, easy-to-use interface and superb efficiency, get this extension for an annoyance-free browsing experience.

Adblock Plus – a must-have
