

iPads can be a wonderful teaching aid that until now, have been a little too overpriced.

onto a bigger display like a TV, making an iPad pretty much the ideal choice. Of course you can achieve most of these with lots of workarounds with other devices as well but it just works here.

Looking Forward

With tablet sales dropping steadily year after year, where does this leave iPad in the grand scheme of things? For Apple, they want iPads to be used more in education while they are still hoping for iPad Pros to be accepted as full laptop replacements. While the former is a very admirable cause, perhaps Apple needs to ease up on the latter and find a new identity for the Pro lineup. iOS on its own isn't very conducive to productivity tasks. iOS 11 promises to solve a lot with a capable File Manager and Drag n Drop photos among all things but it's still a far cry from working on a Mac or a Windows machine. Especially when you consider that a pretty well specced out Windows Ultra-portable costs similar to a specced out iPad Pro with a similar footprint. The iPad Pro is just a product with too narrow a use case offering for it to be very successful. However, the \$330 iPad 5 is definitely a step in the right direction, giving students a chance to pick one up for helping them with studies as well as many more families getting one just for multimedia consumption. There are tradeoffs, sure, but they are very reasonable ones that don't really deter from the experience. Even with this ray of hope for the tablet world, only time will tell – does the world not actually need these anymore? **d**
