

The one that started it all

The future is tense

The last iPod Touch 6th Generation, which is also the latest, was launched in July 2015 – more than two years ago!

The discontinuation of the iPod Classic marked the beginning of the downfall of Apple's music player category. Now with the Nano and Shuffle also meeting their end, Touch remains the flagbearer of the iPod category and is now available in 32GB and 128GB options.

While Apple may be overhauling its other product categories, it must also pep up the iPod soon unless it wants the category to eventually perish.

Apple CEO Tim Cook termed iPod as a declining business and products like the Apple Watch are being marketed as better alternatives.

The 2015 update of Touch had better technology and camera options. But if you were to look at the technological advancements in the last two years, the 'latest' iPod might have become obsolete by the time it gets another update, if at all.

The A8 processor, for instance, might have been the best a couple of years ago, but is slower today, compared to the A9 and A10 Fusion processors. Updated cameras coupled with the graphic properties of the A10 Fusion processor could up the image and video game in the updated iPod.
