

iOS Firsts and Me-too's

Apple built a reputation of doing things first in the industry or rather marketing them to seem so. Fanboys from both sides are quick to point out which things Apple did first and which were first introduced with Android, or rather, who ripped whom off. Here are five things that Apple did first and five other things that Apple implemented way after the entire industry did.

Firsts

1. Apps (as we known them today)

The most obvious thing because Apple got the iPhone out in 2007 while the first Android phone released in 2008. Much has been spoken about who started work on the system of apps first but it was Apple that managed to do it first. Though technically, Symbian Apps had been in existence much before either Apple or Google got around to incorporating apps in their phones.

2. 64-bit mobile processor

The introduction of the Apple A7 chip in iPhone 5S officially made it the first ever phone to have a 64-bit processor.

3. Phone payment system

Apple introduced Apple Pay in 2014 which allowed users to pay straight from their phones. Android and Samsung followed a year later.
