

4. Discarding the 3.5 mm jack

There's absolutely nothing great about this move. This still seems more counterproductive but it's still something that Apple did first.

5. Smartphone Assistant

Siri was the first smartphone virtual assistant. Google Assistant came much later in 2016. This is purely from an apples to apples comparison. Google did introduce the "OK, Google" feature much earlier in 2013. However, Apple filed the patent for a hands free assistant in 2010 which was granted in 2012. So it's more of a chicken and egg situation.

Me-toos

1. Camera Flash

Apple took quite a while to implement the camera flash in iPhone 4. It had been present in Android devices much earlier than that.

2. OTA updates

The phrase Over-The-Air has been synonymous with Android updates since time immemorial but Apple wouldn't implement it in iOS until version 5.

3. Multi-tasking

Apple would tombstone their apps from the beginning, moving data between two apps was a massive pain. Even Cut, Copy, Paste would take a long time (iOS 3) to make its way into the Apple ecosystem. So multi-tasking is an aspect that Apple massively failed at for a long time.

4. Quick settings panel

One of the most convenient features of the mobile OS is getting access to the most frequently used settings in a quick manner. Android has had the drag-down panel for ages but iOS would only see it in version 7.

5. Split screen mode

The Galaxy Note 2 which ran on Android 4.1 had this functionality but it wasn't present universally across all Android devices. So this isn't something stock Android did first but it's definitely something that Apple did later.

What's next in iOS 11

iOS 11 was announced a couple of months back and at the time of writing
