

instantly interact with these objects in an organic way before you decide to, let's say, share your feedback about a new website with your web editor or sign an autograph.

Other implementations involve scanning documents and fixing them up for alignment issues before signing them. You could even add instant drawings to your notes. So if you were emailing someone and wished to add a quick illustration, just start drawing and all the text will dynamically move apart to give your new drawings space. It's like responsive web design, except you can add content instead of just resizing.

- **QuickType**

The Apple keyboard has been a massive downgrade if you were to move to it from, let's say, SwiftKey or Swype. With the new QuickType feature, Apple makes typing much easier by including shift-symbols/keys on the same keyboard. So you can simply slide down on 1 to get an exclamation mark rather than long pressing or shifting to a different screen altogether.

- **ARKit**

VR and AR are huge and ARKit is a new framework that Apple is introducing so that third-party developers can build better AR experiences using the system's resources to the fullest.

New discovery and categorisation in the App Store

Like the Android Play Store which has different tabs for different categories of apps and even new sections that add an element of discovery, Apple has finally decided to wake up and implement the same.
