

CHAPTER #05

tvOS

We take a look at its features, functions, compatibility and its place in Apple's future.

Back in the day when the iPod had just swept the world away and the iMac was considered the perfect melding of tech and design, Steve Jobs had a vision. Reportedly he envisioned a home run on interconnected devices, all somehow running on the same software. At the centre of it all – the veritable hub of all this – would be an Apple television, which jobs believed, would be the next big thing. Sadly, Jobs didn't live long enough to see this particular dream materialise. However, at least a bit of this dream did come true in the form of the device we today know as the Apple TV. It is a diminutive device that connects to just about any modern display and can receive digital data
