

The new Apple Headquarters is life imitating art. A sealed off environment?

of these two environments. Objectively speaking, Apple cares a lot about creating a wholesome experience if you own Apple-only products.

This is where the iCloud comes in. The iCloud is the end product. It is the ultimate aim. Not only do you use all Apple devices, but you trust them with your deepest secrets and most valuable bits and bytes – your cellphone and laptop data. But before we jump into that, there needs to be a basic understanding of what the Cloud really is.

Up in the Air: How data became invisible

Before we start, let us all agree that ‘Cloud’ is a really silly name for a place where data is stored – a remote server, if you will.

The advent of the cloud shifted the fundamental way in which the office ecosystem works. With the cloud, data and compute power could be served anywhere on demand. Now people could log on from the comfort of their homes and work as efficiently, if not more.

It all started a little over a decade ago, when Amazon (then a simple online retailer) offered up a service where other businesses could build and modify all their software without actually having the physical hardware. They didn’t quite grasp the revolution in data management that this would cause, but they had sniffed out the potential in such a venture. Two modern day giants - Netflix and Dropbox jumped onto this train. They have since created global empires of their own. Thanks to Amazon, these companies
