

iCloud is the Apple Cloud service. It is the conduit through which all other Apple products seamlessly serve up their iDelights

Cloud. Unlike the others, Dropbox doesn't provide any service apart from backup. It provides 2 GB of storage for free, and 2 TB for \$12.50. The most popular 1 TB service costs 10 dollars a month. It is a simple service where drag and drop rules supreme. A major drawback is that it has real time collaboration services, so it loses out on a slice of the market because of it.

- **Google Drive:** It functions just like iCloud, but for Android devices. It provides a much cheaper dollar per TB alternative, as 1 TB of storage costs 10 dollars. The trump card is that it provides 15 GB of free data storage, plus unlimited storage for all your Google Docs, Sheets, and Slides. Add this to the fact that unlimited storage for photos up to 16MP is also provided, and you can understand why Google Drive is really the service to beat nowadays. It also has similar real time services that iCloud offers.

While iCloud might not be the most superior of the Cloud storage services available in the market, it is up there with the best of them. For an iOS user, the reason iCloud reigns supreme is because it was designed while keeping the functionality of iOS devices in mind, whereas the others were made for a more general audience. The rare glitches in the system are a small price to pay for the little-to-no effort it takes to implement iCloud into your daily routines.
