

The culmination of Steve Job's Efforts: iCloud

Steve Jobs will forever be the face of Apple. He was behind the advent of the iPhone, the iPod, iTunes, iMac, and all the other assorted iDevices. He led the charge towards a more compact world. As the CEO of Apple, he reinvented how we listen to music, how we work on laptops, and how we purchase software online, but most of all, he redefined cool. With his black polo and his denim jeans, he symbolised the version of geeky cool that software wizards everywhere wanted to be. And it was a two way street. His company made devices that were better looking, better functioning, and better equipped to handle user demands than the rest of its competitors. That is just how it is.

This is the other reason why iCloud is so essential to the Apple ecosystem. Philosophically, it exists for the same reason as the new Apple headquarters.

iCloud is the end product of this cool. You no longer have to use non-Apple devices to store your data. You no longer have to log into iTunes from 3 different devices to listen to 3 different kinds of music. You no longer have to keep re-editing documents you have already edited. You have everything at your doorstep, all courtesy of Apple. All your needs are serviced by Apple. It is an ecosystem that needs nothing else. It is the odd kind of gilded prison (or haven) which you create for yourself. You don't exit it – not because you can't, but because you don't need to. iCloud is the final, invisible brick in the wall. You have been Apple-ified. **d**

One Cloud to rule them all, One Cloud
to bind them
