

thousands upon thousands of unique accents in order for Siri to be rolled out. In the process, they ended up making a decent application rather than the ground-breaking development they promised in the 2011 keynote address.

Siri was meant to be a cross-industry genius instead of the single-use robots that preceded it (read: Microsoft Office's tragic Clippy), and all it needed was access to a multitude of unique Application Programming Interfaces (or APIs) that companies often gave out to 3rd parties. It was meant to be paired with potentially thousands of APIs to supply a continuous stream of information to its user. Not stopping at that, there were dreams to understand the user's idiosyncratic way of talking and respond in kind. Such dreams have remained in the pipeline for too long, but Apple's Siri isn't without promise.

A nicer HAL: Siri becoming a part and parcel of every Apple device

Despite all the idealistic criticism it faces, Siri has become an integral part of every single Apple device. It has reached a point where it is almost unimaginable to hypothesize the future of Apple without simultaneously involving Siri at every turn. It fulfils a multitude of daily tasks - calling, texting, emailing, setting alarms and reminders, checking the weather, and even doing maths problems. It can recognise inputs involving native apps like Twitter and Facebook, as well as search for documents in different folders of the device. It also has the ability to navigate through traffic, find the nearest whatever-you're-looking-for, and keep you up to date on the rise (or fall) of your favourite stocks.

Beginning with iOS 10, Siri finally started to interact with third party apps like WhatsApp, Skype, PayPal, and Uber. However, by far her most

This kind of snark is Siri's calling card. Everyone who has ever owned an Apple device has tried to outwit Siri, before succumbing to her snarky charm
