

## Photos: What does it do exactly?

Well, Photos is the new default photo viewing, organizing and editing application across all Apple devices, be it iPhone, iPad, Mac or even Apple TV. It is what you would use to take a look at all your photos, sync them across devices, organise them into albums, create short videos or do basic editing.

Mind you, Photos isn't a photo editing software and hence cannot compete with a fully fledged photo or video editor like Adobe Photoshop or After-Effects, but it has enough features to take care of your basic editing needs, with more functionalities slated to be added to it with the upcoming updates.

Both the iOS and macOS applications are very much alike. The iOS application's home screen is divided into 4 tabs, namely, Photos, Shared, Albums and Memories. Memories uses various algorithms to make 'memories', which are collection of photos and videos selected from your pictures and are related by date, places or people. The desktop app features another tab, dubbed 'the 'Projects' that lets you create photo books, greeting cards, calendars and prints.

But to fully experience the Photos app in all its glory, you need to set up the iCloud Photo Library feature. Once you do that, your photo library is synced across all your apple devices, automatically syncing every photo and video you take to your iCloud account. And this is where the beauty of the apple ecosystem is highlighted, especially if you are an apple fanboy and have everything apple.

Imagine this: You took some amazing photos on your recent solo backpacking trip to Iceland with your iPhone 7 and you were about to show them to your friends who came over for dinner, but your phone just ran out of charge. No worries. Plug it in charging, pick up your iPad mini, open the Photos app on it and voila, your photo library is there with each photo in the exact quality you took from your phone. Once they leave, you open your MacBook Pro, fire up the Photos App which is also synced with your iCloud account and you can access all the photos directly there. You sort through them, editing a few of them and directly uploading the photos you selected to your social media accounts from within the application. No need to plug in your iPhone or sync your albums across multiple devices every time you want to access a photo somewhere else.
