

Apple CarPlay in India is not too exciting

added Photos to CarPlay – possibly again to avoid distractions. However, all of these combined have somewhat restricted the possibilities that could have been achieved by the system.

Compatibility

For smartphones, Apple CarPlay is compatible with iPhones running on iOS 7.1 or newer. However, you would at least need to be on an iPhone 5, as Apple CarPlay connects via the newer, faster Lightning bus. As for the head units, Apple has a thorough set of requirements from automakers and third party head unit manufacturers, although most of them fall within what is anyway standard for the majority of in-car infotainment systems with touchscreen displays.

The requirements state the need for a high resolution display, and the recommended display resolutions, with varying aspect ratios, are 800x480 pixels, 960x540 pixels, 1280x720 pixels and 1920x720 pixels (for wider screens). For carmakers, the minimum accepted display size is 6.5 inches, while aftermarket options can begin at 6 inches. Each of these displays have to be at least 24-bit colour displays, have 30Hz refresh rate (Apple recommends 60Hz), and have hardware support for H.264 video decoding.

Beyond the display requirements come speakers and microphone requirements. The main audio channel in a car that wants to be compatible with Apple
