

The iPhone is a case study in brand loyalty like no other

see why. Just like every other Apple product out there, it's built really well and the hardware is top of the line for most components. Not to mention the UI and OS are all pretty good, and almost all the apps are optimised.

Just a couple of months and a decade ago, June 28, 2007 to be precise, Apple released the iPhone, which inarguably, revolutionised the whole mobile computing world. Being able to use your finger to perform so many tasks and doing away with implements such as physical keyboards and stylus' to have a (at that time) huge screen was truly an astounding thing. Looking back now, we can say for certain that the first iPhone is one of the major shaping forces of how technology grew from then.

Evolution of the iPhone

The first iPhone was touted as Apple 'reinventing the phone'. And they did. The touchscreen display, with physics-based interactions such as the rubber band bounce when you scrolled to the end of a menu was a technological marvel, miles ahead of the rest of the competition. Apple as a company revolutionized the computing world with Macs, the music world with iPods and looked set to do the same to the mobile phone world with their first offering. The iPhone featured a predominantly aluminium construction
