

50,000 tracks that you can stream across the Google ecosystem, or practically anything with a web browser. Along with better audio quality overall, Google's search algorithms and better pricing, Google gets this one with a decent margin, thanks to its features.

- **Microsoft - Groove Music**

Groove Music, although not available in India yet, does offer great cross-platform support and the standard rich library and also supports music from OneDrive. With a bad update record, poorer audio quality and the absence of a shared usage plan, we'll like to skip on this one.

Sync

Seamless transition between devices within an ecosystem can essentially make or break the ecosystem itself. That is the reason why all three of the tech companies we are discussing have put a good amount of energy and effort into that, although we can't say that the experience is the same for all three.

Apple has maintained iCloud (with your iTunes account and Apple ID) as a universal sync service on its ecosystem for a while now. It is really easy to change devices within the ecosystem. On the other hand, Google's account based data synchronisation is also more or less a similar offering, although the experience might depend on which device you are using (since Google does include multiple OEMs across its ecosystem). Microsoft, due to the lack of multiple services offered by competitors like Photos from Google, doesn't measure up in the sync-game. On the other hand, it does restrict you in certain ways. This can be a pain to use if you're trying to move out of the Windows Phone ecosystem – which you should.

Virtual Assistant (VA)

- **Apple - Siri**

While Siri can now understand most standard queries, it can now also perform actions using many third party apps – which is big move from Apple. Along with a personality, Siri offers minor additional features every now and then that keeps Apple loyalists hooked to this popular smart assistant.

- **Microsoft - Cortana**

Based on data gathered across the current Microsoft
