

ecosystem, Cortana can suggest contextual information when and where relevant (Yes, the Xbox too). Although it doesn't have significant IoT capabilities right now, that might change in the near future.

- **Google - Assistant**

With a function over form approach, and backed by Google's treasure trove of data, Google's VA is a serious contender. It is available on Android and iOS devices which includes wearables and TVs as well. There is a reason why almost all such comparisons have shown Google Assistant taking the lead over the other two, even though Cortana comes almost at par in terms of features.

Automobile software

As you've probably gathered from the previous chapter, we've pretty much declared Android Auto miles ahead of Apple's CarPlay. Apple Maps is one of the main reasons, the other being a slightly more optimised UI. Go back a few pages for a more detailed explanation.

TV

- **Apple - Apple TV**

The design and user experience will seem familiar to Apple loyalists who are used to the sleek, stylish experience on other devices too. That being said, the experience is a bit too Apple centric. So if you own an Android or a Windows device, your life won't exactly be easy with the Apple TV.

Additionally, apps and games aren't always available immediately but they do sync with your iPhone when they are. But another area where this earns bonus points is that it's hooked onto your HomeKit enabled devices as well, so you can control your smarthome right from your Apple TV. Good job Apple!

- **Google - Android TV**

With Android TV, Google has provided its software for many manufacturers to use on their smart TVs. With the likes of NVIDIA Shield available on one
