

side and an average TV on another, the experience, especially on games, can vary even with ample availability of apps. It would have been even better if the voice search functionality with Google Assistant could also be used to navigate within videos and content, like it can be done with Siri on Apple TV.

- **Microsoft - Xbox ?**

As of now, the Xbox is what comes closest to being Microsoft's dedicated TV solution. While it does offer a decent number of apps and services (Netflix, Crunchyroll, Skype, Twitch, YouTube and more) it is not nearly as rich an ecosystem as its competitors.

Payments

- **Apple - Apple Pay**

When it comes to payments, there's little that differentiates the technology between Apple and Google. Both use virtual cards to keep your details safe. Both of them have

a ton of banks and stores on-board. Apple does have a more restrictive environment though. For instance, it will only work on Apple devices and wearables. On the phone front, it will only work with iPhone 6 and onwards since previous models didn't have the NFC chip on them.

- **Google - Android Pay**

Google evolved its Google Wallet offering to what is Android Pay today. Any Android device with NFC and at least Android Kitkat can use Android Pay. In fact, Wear 2.0 is going to be more iOS friendly and it will support Android Pay. Google takes this one for the inclusivity and flexibility.

- **Microsoft - Microsoft Wallet**

Yes, Microsoft does have a payment solution too for its smartphones. But with the Windows Phone almost dead, is it even valid to consider it as an option?

Developer friendly

All tech ecosystems thrive on a vibrant and active developer community building stuff for the ecosystem. When it comes to Apple, Google and Microsoft, there are multiple factors that play into the choice if you're a
