

developer. To start off, the technology stack on Apple and Microsoft have offered some of the leanest and easy to use languages from the beginning, with Java based Android catching up over time. There are also a couple of added incentives in developing for Apple. First, you do not need to worry about more than a few devices at a point of time. Additionally, iOS users and Apple customers are more likely to pay for applications as compared to people on the Google and the Microsoft ecosystem. This is because free alternatives are available in the Google ecosystem and piracy is easy in the Microsoft one. This one goes to Apple.

Wearables

- **Apple - Apple Watch and watchOS4**

Once again - the restriction game. The Apple Watch only works with the iPhone as of now, so if you have any other smartphone or plan to buy one, your choice is pretty much made for you already. But just in case, you are an iPhone owner, you do have certain options in terms of design between its multiple models in the form of band and case material. With the recently announced GymKit, Apple Watch owners can now also sync data with gym equipment. Overall, the experience on the Apple Watch is better if you stick to the Apple ecosystem.

- **Google - Android Wear 2.0**

Google brings in diversity in the form of multiple manufacturers making smartwatches powered by Wear, and now Wear 2.0. You even have some standalone options that are not available for the Apple ecosystem. Additionally, Android Wear watches get their own Play Store, music library along with other standard functionalities. Of course, you also get cheaper options compared to the Apple Watch.

- **Microsoft - Unnamed smartwatch**

After Microsoft officially cancelled the Band 3 earlier this year, things haven't looked great for the wearable department over there. But an unnamed smartwatch is on the way soon and little is known about it other than it being business focussed.
