

Security

We don't need to go down to individual ecosystems on this one. The Microsoft ecosystem, with the Windows platform in it, easily faces the largest number of attacks for the maximum gain possible. As a result, statistical analysis points to Microsoft being weak in terms of security. Similarly, due to the large number of Android devices out there, combined with the not-so-stringent Play Store policies, Google also faces a lot of security issues in the form of malware and dangerous apps. Apple, on the other hand, takes security as a primary requirement in its development process and also does not face as many attacks as its competitors due to fewer devices being out there in the market at a given time.

Home automation

- **Apple - Homepod**

Until very recently, Apple did not have a dedicated device in the home automation segment. The Homepod is not out yet, although some of its specifications are known. It is being pitched first as a quality speaker, although it is compatible with all of Apple Homekit supported devices (which could be controlled by any of your Apple devices before this). Once again, Apple's specific requirements for devices to be HomeKit compatible might have turned out to be a problem for smaller developers. While little is known about the actual device yet, it is not hard to tell that it has a lot of catching up to do.

- **Google - Google Home**

Google launched its home smart speakers by positioning them as entertainment hubs but over time they have learnt a lot of new stuff to become a solid alternative to Amazon's Alexa, which currently leads the smart home speaker market. With Google's Home it is definitely easier to control content on multiple devices as long as they are Chromecast enabled. Additionally, you can also train the Home speaker to recognise voices of different family members.

- **Microsoft - Harman Kardon Invoke**

Unlike the others, Microsoft is not manufacturing its own smart speaker but actually going ahead with Cortana on a Harman Kardon-make speaker
