

named Invoke. Little is known about the device and whatever is out, indicates that it's going to be pretty similar to Amazon's Echo. Also, no pricing details are expected until the Fall 2017 launch.

That's all folks...

And with that we are done. It is practically an impossible task to figure out a clear winner from all these comparisons, although we might just try to do that in the near future with a more detailed test process. As of now, it is evident that Apple's entire ecosystem is built around strict quality control and standards, even if that leads to less content on their platform. In fact this has played to their advantage with developers preferring Apple for this very reason, and loyalists sticking with Apple for the quality it offers. That being said, it wouldn't exactly be right to say that they are perfect. They are quite far from that. As any Android user would tell you, the Apple ecosystem preaches the lack of customisability within it as a design benefit. Basic features that

have existed on Android for ages have sometimes taken ages to show up on iOS. For geeks and enthusiasts that does bode well. It's the very reason why people looking to play around with their devices and experiment with applications and hardware stay away from the Apple ecosystem. Now, it is up to you to decide what exactly you want from the Apple ecosystem. **d**
