

Most of us who are dependent on the internet for every little detail. Don't know something? Google it. Can't remember something? Google it. What's the name of this song? Google it. If we have a query, we (all together now!) "Google it!" Like Xerox is for photocopiers, Google is for search.

With over three billion daily searches, Google is by far the most popular search engine today. Started as a research project by founders Larry Page and Sergey Brin, Google was initially hosted under the domain of Stanford University, where the duo studied.

Google was initially named as Backrub

In the late 1990s, which were Google's inception years, it had some 60 million pages in its kitty, more than its then competitors Hotbot and Excite.com.

Formed right around the cusp of the internet revolution in the world, Google managed to attract and retain a loyal consumer base which appreciated the search engine's simple design and user interface.

After dabbling with the idea of ad-free search engines, the founders soon gave in to a text-based form of advertising and started selling advertisements with search keywords in the year 2000. While the technology giant's initial and most celebrated product remains the search engine, it provides an array of utility, networking and entertainment products, which reiterate the company's stronghold in the global marketplace.
