

Google's PageRank algorithm has managed its search engine to surpass the capabilities of its alternatives

based on the number of references to that book in other works. Larry Page came up with a system to assign value to a page based on the number of links it had and also the number of times the page was linked to another page. Hence, the name PageRank.

In 2013, Google changed its search engine algorithm, in an update called Hummingbird. It was introduced to make search results more precise. Rather than focussing on just a few keywords to provide search results, the new algorithm focussed on each and every word of the search input to accurately provide what the user wanted.

Search personalisation

Now it is the most basic thing that Google does to make your search results more relevant to you. The PageRank algorithm comes into play here – popular, and relevant, is the key.

Google uses your history and frequently looked up pages and links in order to provide you better search results. Your location, search history, web history and social network records are used to provide you personalised search results. Ever wondered why you keep seeing advertisements of that Laptop you just looked up on Amazon? Just Google doing its job!
