

cians, etc., or a current event, then Google News results show up next to or above the regular search results.

For image search, while most people search for images using text that describes the image they want, Google also has a reverse image search option. The reverse search lets you upload or link an image to the search bar and Google will find similar images from the internet, social networking platforms, etc.

Click the camera icon to do a reverse image search

In June 2017 Google also added on a Jobs feature, which studies the job openings on various company websites and then aggregates them for you. It's location based, so just Google 'Google Jobs' and it will show you a list of job opportunities available in your current location.

Google Instant

After having launched this default search option in 2010, Google dropped Instant Search in July this year, because half of Google's searches were taking place on mobile phones. The idea behind Google Instant was to make searching more efficient by displaying suggested results as the user typed in the first few letters or words into the search box. However, you always had the option to turn off the instant search feature in your browser settings.

At the time when it was launched, it was expected that Instant could save two to five seconds of the user every time he searched something. Now with the search activity steadily moving to cellphones, where we use our fingers and virtual keyboards to perform searches, Instant search does not make as much sense. While it was hailed as a 'fundamental shift' in the way we search, it's been done away with because Google wants to make search fluid across platforms, as reported on Search Engine Land.
