

When companies like Samsung and LG came to know about Android, they were obviously interested. They would have a good, functional back end for any hardware they wanted to make. And as Android was open source, it could be used to develop any virtual platform. The possibilities were endless. But there was another problem. These companies had some issues regarding the brand of Google being associated with Android. After all, manufacturers of the likes of Samsung and LG didn't want Google logos

Android games were important in making the OS so popular and loved

appearing in their devices. Many manufacturers tried their hands at their own OSes, but eventually had to give in, because the Android juggernaut ground all efforts into the dust.

Everything eventually worked out for the best, and Android is the biggest operating system in the world. It has changed the way people live their lives. Ushering in an age of applications like WhatsApp and Snapchat and games like Angry Birds and Clash of Clans. So let's take a look at what happens under the hood for Android.

Open Source

While designing the software for a computer to run, you would need to specify certain constant features. You would need to set some rules which would define the way the computer handles problems. You also need to set the rules for interaction with peripherals like the keyboard, mouse etc. This critical code, which is the most important program of an operating system is known as the Kernel of an OS. Obviously the
