

patible vehicle or aftermarket radio, and an Android phone running 5.0 (Lollipop) or higher. This allows you to perform tasks such as navigation, using Google search, getting weather updates, making and receiving calls, etc., with mostly hands-free ease.

Home Automation

Because of the internet of things, smart devices can be connected to a hub, and that hub easily controlled by an Android smartphone. The phone can be used for a lot of tasks like unlocking doors via bluetooth proximity detectors, thermostat control, controlling smart bulbs, getting alerts on your phone via the security system, and much more. You're only limited by your imagination, and there are tonnes of DIY projects to be found online.

Tablets

This is one place we think iOS has trounced Android. The Android tablets just cannot match the iPad, and although the tablet market itself is slowing down or dying (depending on which report you read) it's pretty much iOS dominated. The only real success story for an Android tablet was the Nexus 7 made by Android and ASUS. It wasn't as good as the iPad or iPad Mini, but it was cheap.

The Nexus 7 was a fun cheap alternative for anyone who wanted to own a tablet computer
