

GPS support, Android Wear users were ready for more and they got exactly that by Christmas.

Android Wear 1.0

Google decided to ditch the version-tied numbering around when Lollipop launched. Android Wear 1.0 launched December 2014 and since then has accompanied corresponding Android versions upto Marshmallow. Android Wear 1.0 turned out to be Google's testing grounds for all things smartwatch-wise, with a number of releases adding features that made the platform a lot more comprehensive and robust – but still not independent of the smartphone.

While the first version brought about the much awaited Watch Faces API along with features such as sunlight mode, Theater mode, and UI upgrades, it was Android Wear 1.5 that brought in things like gestures, WiFi and speaker support. It was also compatible with way more Google services, such as Google Translate for Wear.

Android Wear 2.0

Noted as the biggest update to Android Wear since its inception, Android Wear 2.0 has been hailed by many as something that will save the Android

Huawei Watch 2

smartwatch. First things first, it did improve the user experience significantly. With Material design, improved notification handling and a much better app drawer experience, Android Wear 2.0 has taken Google much closer to catching up with Apple in terms of user experience on a smartwatch.

One look at the features that have been added on top of the user experience, and one can get a sense of why Wear 2.0 is such a big deal. While a standalone Play Store removed the need to be paired with your smartphone to get any apps at all, cellular connectivity support essentially makes it an inde-
