

Michael Kors Access

pendent device – one that does not rely on your phone to handle calls and messages. Needless to say, standalone apps also make much more sense out of the iOS support that Wear provides.

Google also introduced new watch widgets – named ‘complications’ (which is exactly what Apple calls its own equivalent feature as well) – which allow you to use Google’s own as well as third party widgets with your

favorite watch faces. Without going into too many details, suffice to say that this allows you to create multiple unique watch faces with a single (or multiple) watch face to begin with – say, for your home, office and transit.

While the built-in keyboard, handwriting recognition and local support for features like smart replies made user input a lot easier, Google hasn’t arguably done a great job by slapping on a full-fledged keyboard onto a watch face. But then again, the platform is open to third party keyboards, and that has always been Google’s USP. You also get Google Assistant and Google Pay (albeit on phones that support it, like the Huawei Watch 2).

Android Wear 3.0?

Whether the next update will be a direct jump to 3.0 or iterations to 2.0, there are some pretty interesting patents that Google has been granted (or acquired from Motorola) over the years that keep the door open for many interesting possibilities. Some possibilities point at a Google Glass-like camera enabled smartwatch that would show location and context specific information on the display, other designs indicate at a touch-enabled wristband for

A future smartwatch could potentially out-smart the smartphone
