

the watch itself, much like the touch-panel on the Google Glass.

Other input methods include a flexible screen and a multi-sensor powered gesture-enabled smartwatch design. But perhaps the most interesting possibilities arise from a couple of patents that indicate medical use cases right out of science fiction. A couple of patents in 2015 show how the watch could administer medi-

cine using nanoparticles directly into the bloodstream, and similarly take blood samples for local analysis as well. Even if all of this doesn't see the light of the day, some of it might make it to a potential Pixel watch.

LG Watch Sport

How to choose an Android Wear smartwatch?

While the abundance of choice delights any customer, it also leads to a harder choice to actually make. Although, in case you have your use case clear, there are some pretty clear winners in Android Wear that could be just the right fit for your wrist.

Overall, the LG Watch Sport does the best job so far, especially by having the holy trinity of GPS, NFC and LTE support. It also sports powerful hardware and it wouldn't be a far stretch to say that this is the Nexus (now Pixel) of Android Wear smartwatches.

Beyond that, for luxury you're better off with Michael Kors Access if you're looking for a luxury Wear watch, whereas the Polar M600 works fine for running enthusiasts. Overall, you have plenty of options to choose from, if you are going for an Android Wear watch at all. With the platform suffering from lagging updates just like the overall Android ecosystem, it is truly a subjective decision at this point. **d**
