

200 styles with the Moto Maker), the Moto X was no slouch in the internal department either. It had a Qualcomm Snapdragon S4 ProMobility SoC and 2 gigs of RAM and was available in 16, 32 and 64 gig variants. It caught the eye of the public quickly with the customization possibilities as well as the made in the USA tag (which sparked patriotic sales) and served to implement a lot of features that only recently have made their way into modern smartphones. Things like twist to open camera, using always-on notification text on the screen itself rather than a single notification LED, always listening voice assistants... all this the Moto X did first.

A few months later, on November 13th of the same year, the Moto X got a cheaper cousin, the Moto G. Priced extremely competitively in the mid range section, it had a Qualcomm Snapdragon 400 SoC with 1 GB of RAM and was available in both 8 or 16 gig variants. This phone was truly a game changer, more than the Moto X was. The low price tag and great spec sheet spurred huge sales throughout the world, especially in countries like the UK and India. At one point of time,

While Moto G didn't have moto maker, it did have it's share of quirky color backs

the Moto G even became the most common smartphone here! And a few months later, Google not settling on their laurels with their midrange offerings, announced the Moto E in May, 2014, amidst brokering a deal to sell Moto to Lenovo. The Moto E followed the Moto G's formula of great specs and a low price and packed a Qualcomm Snapdragon SoC inside. The Moto E was aimed at converting a lot of the people who were still using feature phones into Android users and we can safely say they achieved that goal. Both the Moto E and Moto G were harbingers of the Smartphone Revolution in India and paved the way for many more companies in the years to come. But soon after the announcement of the Moto E, the Lenovo acquisition of Motorola took place and therefore, all phones after that cannot be considered Google products anymore.
