

• Nexus 6

A year later, on October 29, 2014, Google along with Motorola, released the first so called ‘phablet’ in the Nexus line. The design was quintessentially Motorola, looking very similar to the Moto X, down to the dimple in the middle of the back where it feels, oh so natural to rest your index finger. It had a hard plastic shell on the back (but missed out on the Moto Maker customizations – with only two color choices, blue and white) The front bezels were also trimmed down a bit, to make the huge phone more wieldy. And that was a change this phone definitely needed just because of the massive 5.96 inch AMOLED screen , with QHD resolution (2560*1440p) and a pixel density of 493 ppi. The inside was also flagship level, with a Qualcomm Snapdragon 805 SoC with 3 gigs of RAM and was available in both 32 and 64 gig variants.

Quintessentially Moto

The Nexus 6 came out with Android 5.0 Lollipop, introducing all new “Material Design” to the previously drab and minimalistic interface. Material Design emphasized on colors, vibrancy and motion and it was truly a pleasure to see on such an expansive display. The reviews for the Nexus 6 were glowing except for one tiny snag – the phone was just too big. It was hard for people to recommend the massive screen to anyone except people who really wanted the biggest screen they can get for

multimedia consumption but don’t want to lug around a tablet. It was truly unfortunate that the Nexus 6 had to be the scapegoat for everyone to figure out that about 5.5 inches was the screen sweet spot for mobile phones and therefore, the similarly specced Moto X 2nd generation did much better than the Nexus 6. But at the same time, there was a niche market for phablets as well, to which the Nexus 6 catered admirably too. So even if the main targeted demographic of ‘specs-sheet seekers on a budget’ didn’t buy the Nexus 6, the people who loved the concept of phablets lapped them all up even if the Nexus 6 trended towards the higher end of the price spectrum.
