

• Nexus 5X and Nexus 6P

And then a year later, we come to the final saga of the Nexus' phone line. On September 29, 2015, Google announced not one, but two new Nexus smartphones – The Nexus 5X in conjunction with LG and the Nexus 6P with Huawei. While the two shared some similarities such as being the first phones with Android 6.0 Marshmallow and had Google's fingerprint sensor (Nexus Imprint) in a never before seen position on the back, charged via the new USB C standard and had similar design language, they were both two distinct phones.

This was major push for other manufacturers to pick up USB C

The Nexus 5X was marketed as a successor to the Nexus 5 to attract back the people who were put off the Nexus 6 due to the size. It featured a hard polycarbonate shell on the rear with a significant camera bump while the front was dominated by the 5.2 inch FHD (1920*1080p) screen with a pixel density of 423 PPI. The Nexus 5X used an IPS display this time around also but worked on the brightness since that was a major sore point on the original Nexus 5. On the side, it had a Qualcomm Snapdragon 808 SoC with 2 gigs of RAM and also featured a vastly improved camera sensor. Basically, they took everything that was wrong with the Nexus 5 and made it all better. A sure recipe for success, right?

Well, it would have been, if the Nexus 6P didn't steal all its thunder. Google's first effort with Huawei yielded a beautiful, aluminum unibody phone

We're partial to that Glacial Blue ourselves

(a first for the Nexus line up) that was just jaw droppingly spectacular. Emphasizing on the fact that the P in the name stands for premium, Google and Huawei labored hard to make the Nexus 6P a true flagship in every sense of the word. It featured a top of the line Qualcomm Snapdragon 810 SoC inside with 3 gigs of RAM and was available in
