

32, 64 and 128 gig variants. The camera was cleverly placed in a horizontal strip on top of the phone's back to avoid a camera bump and was easily the best camera seen in a Nexus phone till date. The screen shed a few mm to become a 5.7 inch screen, to emphasize a little bit the ph part of 'phablet' while still retaining an expansive screen for the multimedia hogs. It still had the AMOLED WQHD 2560*1440p screen with an eye popping 518 ppi.

The fact that the Nexus 5X started at \$379 and the Nexus 6P started at around \$449 didn't help things much for the 5X. Added to this was the usage of the Snapdragon 808 SoC and not the 810 as well as a measly 2 gigs of RAM

This just exudes that premium flagship feel

tanked the sales of the 5X. There was also a huge group of disgruntled people who felt that Google had moved away from its original best bang for your buck smartphones of the Nexus 4 and Nexus 5 into costly affairs such as the Nexus 6 and Nexus 5X/6P, started abandoning ship to go to one of the many competitors Google now had who

offered similar features as a Nexus phone at a lower price point. Hell, even the Moto X apparently was more attractive to people than a Nexus. The competition had finally caught up to Google and this (sadly) signaled the end of an era. Google announced that it had no more plans to make Nexus phones after the launch of the 5X and 6P

The Future

Happily for us geeks, it didn't mean that Google totally stopped making phones. It just decided to take things into its own hands and develop both the hardware and the software inhouse and would a year later, give us the Pixel and the Pixel XL. And the fact that Google is working in close collaboration with HMD to give us new Nokia phones is indeed exciting. Could the Nokia phones be considered a spiritual successor to the Nexus line? Or is that chapter done and dusted? Either way, we have the all new and exciting Pixel lineup to look towards as well as have fond nostalgia about the legendary line that spawned it.
