

The screen differences are truly staggering

to the build quality, and was touted as the Fire's killer. While the iPad was undoubtedly the best tablet amongst the three, the Nexus 7 offered a better, more wieldy size of 7 inches compared to 9.7 inches and a much MUCH more attractive price. Although, the former advantage was negated in just a few months with the launch of the iPad Mini.

The Nexus 10

After Google's searing success with the Nexus 7 in the summer, everyone quickly took notice of the second reference tablet when it was announced. Google, in partnership with Samsung this time, announced the Nexus 10 on October 29th, 2012. The Nexus 10 drew *it's* inspiration from the Samsung Galaxy Tablet 2 10.1, which wasn't really considered a great tablet due to it's underwhelming ...everything, but Google, along with Samsung managed to tweak enough of the settings to make the Nexus 10 a totally different beast altogether.

The Nexus 10 boasted of an astounding 2560*1600 resolution with a pixel density of 300 ppi and was the highest resolution tablet that was ever released at the time. And that was pretty much it's only redeeming feature, except apart for it's price. It's hard to argue at a \$399 starting price especially when competitors like the Samsung Galaxy Tab itself and the iPad started at an easy 100 dollars more. The dimpled back from the Nexus 7 vanished, unfortunately giving way to a soft touch plastic back, which was OK, but didn't quite inspire like the 7. Another notable point about the Nexus 10 is it's front facing stereo speakers that fired upwards – a rare sight in tablets at that point. It rocked a Cortex A15 chip on the inside, which was decent
