

for most everyday activities but lacked a little ‘oomph’ for more intensive work. Even though it had a 9000 mAh battery, it only lasted for a paltry seven and a half hours. Alongside the Nexus 4, it was the first device to ship with Android 4.2 (Just Jellybean again).

Those curves though

The reception for the Nexus 10 was lukewarm. While its screen resolution was highly praised, the color accuracy and saturation levels were a big let down. Added to the fact that competitors like the Asus Transformer Pad Infinity TF700 (seriously, what’s up with Asus and 17 syllable names?) were faster, lighter, thinner and in the case of the iPad and the Asus, had a brighter and

more vibrant screen, the Nexus 10 was just a interesting device that people just looked at instead of buying, only perhaps if they were on a budget.

The Nexus 7... again?

Following the huge success of the original Nexus 7, Google and Asus went back to the drawing board together to design a more evolved version. It was released on July 26th 2013, four days earlier than it was supposed to release because some retailers (cough cough Best Buy) couldn’t bear to keep it a secret any longer. Freed from the constraint of cutting down an existing tablet design (of the ME370T) to a cheaper price point, Asus and Google could truly work on evolving the design of the Nexus 7. They took pretty much all the good things of the original, and made it even better.

The excellent dimpled back was replaced by a matte black plastic shell, which while wasn’t as reassuring as to hold as the former, still felt pretty good in the hand. The Nexus 7 also dropped a significant amount of weight, becoming both thinner and lighter than the original. The side bezels around the screen got a few mm shaved off but unfortunately, the chunky top and bottom bezels remained. Google and Asus maintained this was done to ensure that you could hold the tablet in landscape without smudging the screen but it’s still a little disappointing. And talking about the screen, we have come to the best part of the newer version. It was a crisp Full HD 1920*1200 screen with a pixel density of 323 ppi (compared to the 1280*800
