

the benchmarks very pretty heavily skewed towards the quad cores in most tests. However, when it came to real world usage, especially in graphical workloads, the K1 was able to take on pretty much anything without breaking a sweat. Added to fact that Lollipop finally ditched the Dalvik runtime to

At least, it sort of matches lollipop

wholly switch over to ART (Android Run Time), the Nexus 9, at least on the software front, was an absolute joy to use.

Like mentioned earlier, the public wasn't very enthusiastic about the Nexus 9's hardware design. While it was relatively inexpensive (starting at \$399 for the 16 gig WiFi only version) it's competitors like the Samsung Galaxy S Tab and the Kindle Fire HDX 8.9 offered just a teensy bit more of reasons to choose them over it – unless getting bleeding edge Android updates were your thing. It received mixed to positive critical reviews but finally in the end, all the amazingness of the software couldn't cover up the inadequacies of some of the hardware.

Why did people buy Nexus Tablets?

We've already expressed our sentiments about why people buy tablets in the previous Fast Track to Apple. It's a comfortable mix of portability and performance and one can have versatile uses for it – specifically tasks that a phone is just too small for but a laptop is too big. But why Nexus? For the most part, the Nexus line of tablets has always been about incredible value for money. The combination of good hardware plus stock Android was an irresistible combination for Android tablet aficionados. Being the one of the first devices to get the next latest version of Android was an added bonus. Added to the fact that the tablets are always on the cheaper side while not compromising much or having many trade offs, they are usually a good fit for a Geek who doesn't want to join the dark iOS side. Unfortunately, the Nexus line stopped after the Nexus 9 and the whole branding was dropped altogether the next year.
