

thingies, Chromebooks, Chromecasts, etc. Then there's so much more software in the form of Chrome OS and much more. In fact, there's just so much that Google does, that we cannot possibly cover it all in a single fast track. Perhaps you noticed the (Part 1) on the cover of this book, and that's because next month we're going to cover all of the stuff you will undoubtedly find missing in this book. Remember to book your copy early with our attractive prebook offers.

All in all, Google is a consumer technology behemoth, and is also a dominant player in the coding and small business segments. Heck, even in enterprises you're undoubtedly going to be working with some Google product or the other.

Even when it comes to path breaking technology Google is often very much abreast of the leaders, or is the pioneer itself in the field. In the popular fields of augmented reality and also virtual reality, Google was one of the pioneers, and still cannot be discounted as a major player. And that's things they don't have a huge focus on. In AI, which they love, Google is forging ahead with their artificial intelligence projects such as their smart assistant simply called Google Assistant. Under the parent company Alphabet they're also researching driverless cars in a big way, and putting AI to work in many other fields.

This Fast Track will try and get you to become a whiz at using most of the things we've mentioned in this intro, and some that we just don't have the space to go into right now. It's going to be a long read, especially across the two books we have planned (heck we could do three, and still not cover everything Google does)! Without further ado, let's move on to our Fast Track to Google (Part 1).
